

- Situation**
- One of the largest retail distributors of automotive and aftermarket parts was experiencing increased pressure on pricing as well as demands for service consolidation in a highly competitive market
 - To satisfy market demand in several customer segments, an online ordering platform was developed and launched by the client, with an initially positive reception
 - Use of the ecommerce platform was intended to be embraced by the majority of users, however, the adoption rate was far below expectations
 - To help create a greater awareness of the ecommerce platform, subsequently increase usage, as well as improve overall site functionality and performance; a proactive customer feedback mechanism and early warning system was developed and deployed

- Objectives**
- Gather a greater understanding of customer satisfaction and loyalty relative to their impact on profitable growth
 - Identify service and quality improvement opportunities that will increase customer performance and usage of the ecommerce platform
 - Positively impact customer satisfaction and loyalty metrics to increase customer repurchase and retention rates
 - Help to create a marketplace advantage for the client
 - Proactively identify defectors/decliners to mitigate customer attrition rates

- Approach**
- Architect the overall customer experience feedback strategy and associated methodology
 - Develop and test survey instruments for multiple customer segments to ensure participants meet the desired feedback and detail levels
 - Select and customize a data capture tool (CRM) to manage survey feedback, productivity, calling results and escalations
 - Develop and generate survey feedback analytics to drive business decisions that gauge customer feedback and drive continuous improvement

- Results**
- Client reported a 30% rise in profit from the prior fiscal year in conjunction with an overall 4% rise in sales from the previous year
 - Customer ecommerce platform usage increased by over 50% in the first year following the launch
 - A relatively unexpected result was the high percentage of escalations identified (60% of all completed surveys) that required immediate client intervention to mitigate defection risk
 - Escalations included: unreported issues, platform training needs, implied high potential to defect to competition, etc...
 - Centralized survey results identify reasons for defection/decline in customer spend
 - Client leveraged customer intelligence gained from research conducted by Apexx Group during initial pilot launch to develop significant system enhancements, which were incorporated into a new ecommerce platform launched one year later
